FINALIZED MAY 2022

PROJECT DESCRIPTION & EXISTING CONDITIONS

Ridgeway Traffic Consulting (RTC) has been retained to evaluate the traffic and transportation impacts resulting from the construction/occupancy of a proposed single-family attached residential development west of S. Irby Street and south of Cherokee Road, in Florence, South Carolina.

Evaluation of the transportation impacts associated with the proposed project first requires a thorough description and quantification of the proposed project and the project site, which is included in the following sections.

PROJECT DESCRIPTION

The project proposal is to construct a new single-family attached residential development with 60 dwellings along the west side of a new access road (Creekview Drive) west of S. Irby Street and south of Cherokee Road in Florence, SC. **Figure 1** depicts the site location in relation to the local and regional roadway system. **Figure 2** depicts the development plan and conceptual roadway extension plan as currently proposed.

As part of the project, a new access roadway (Creekview Drive) is planned to ultimately connect Cherokee Road to the north, traversing south and east and connecting to S. Irby Street. The existing Indigo Pointe Access Road would also provide a connection between S. Irby Street and the Creekview Drive. Two direct access drives for the project are proposed to Creekview Drive. It is understood that FEMA coordination will be needed to complete the connection to Cherokee Road. An alternate scenario (Interim Scenario) has also been reviewed where the connection to the north to Cherokee Road is not provided. For this scenario site traffic would utilize the connection to S. Irby Street to the south of the site, and also the existing Indigo Pointe Access Road that ties to S. Irby Street just south of the Jiffy Lube and Italian restaurant approximately 600-ft. south of Cherokee Road. Analysis of both scenarios have been completed as part of this traffic study. Recommendations for both direct access points are provided in the Mitigation section of this report.

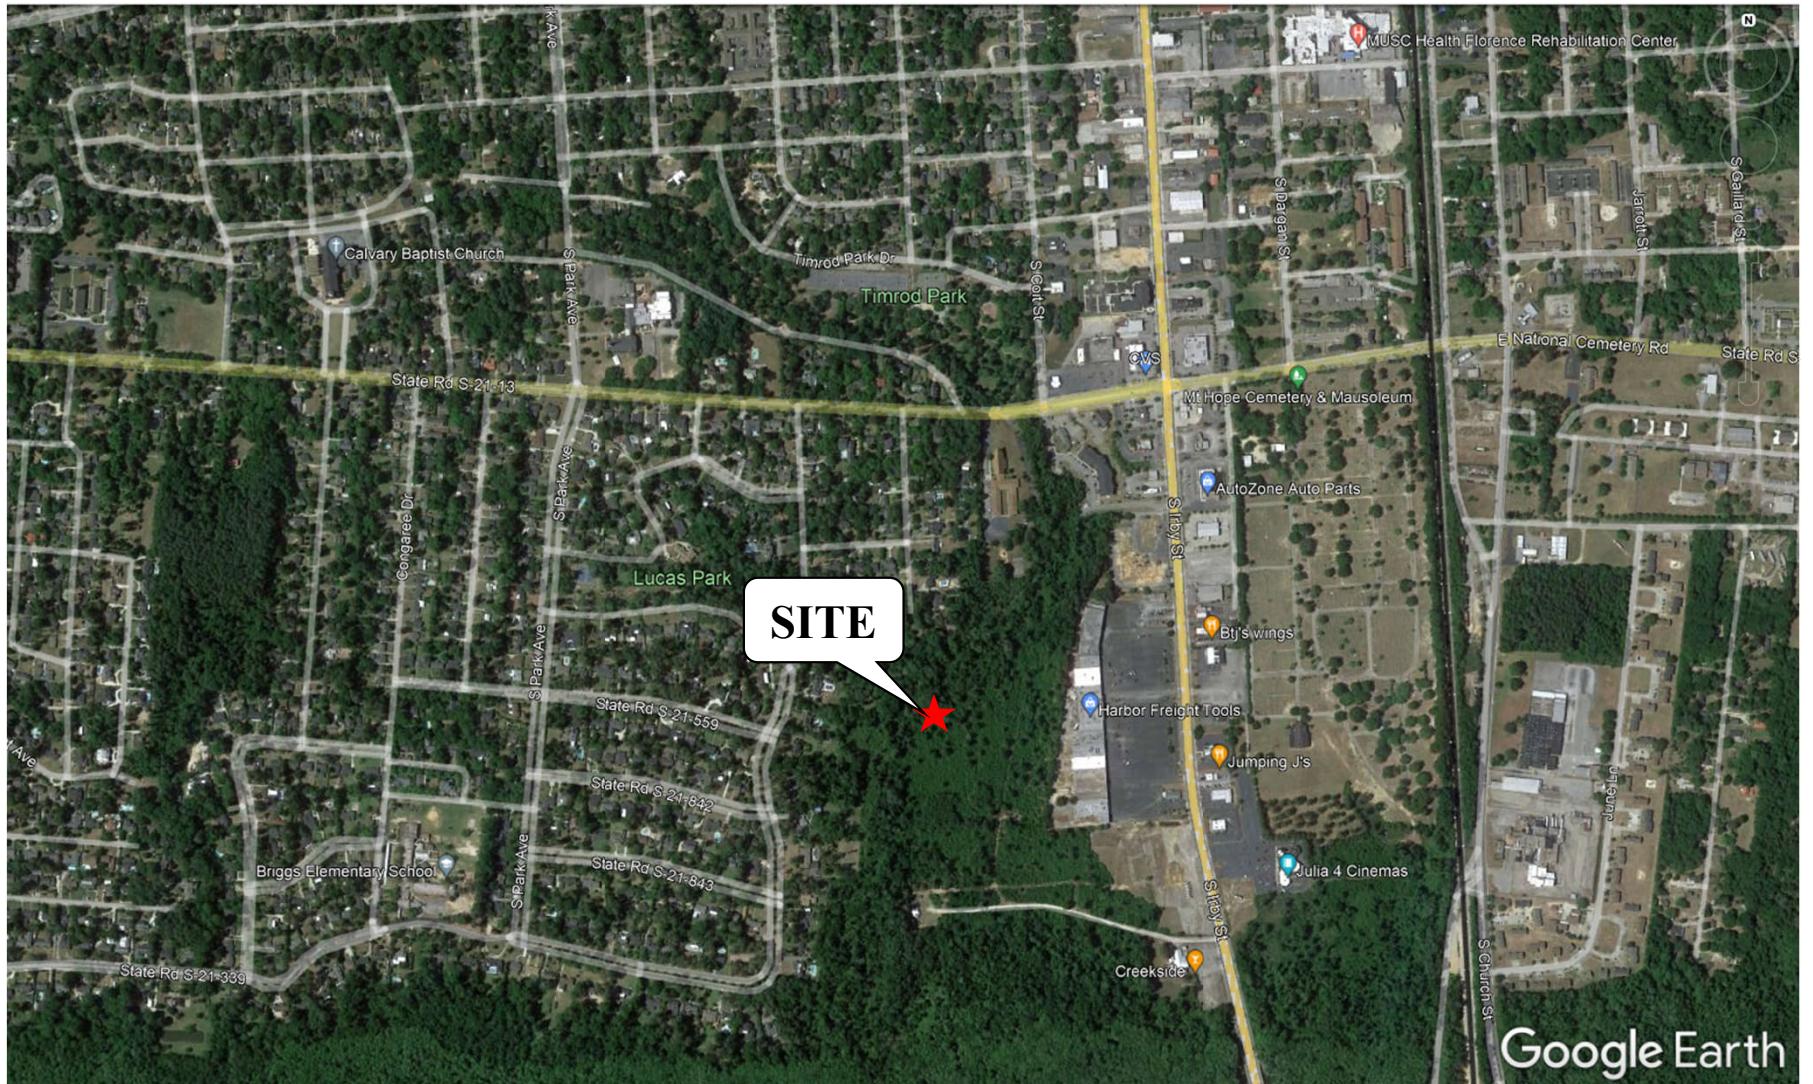

The project is expected to be developed and occupied by 2024, with is the horizon year reviewed for this report.

GEOMETRICS AND TRAFFIC CONTROL

A comprehensive field inventory of the site and study area has been conducted. The field inventory included a collection of geometric data, traffic volumes, and traffic control within the study area. The study area for this project consists of the following intersections based on correspondence with the City of Florence:

- 1 S. Irby Street at Cherokee Road;
- 2 Cherokee Road at S. Coit Street; and
- 3 S. Irby Street at Indigo Pointe (private drive).

The existing lane geometrics and traffic control characteristics for the study area roadways/intersections are graphically depicted in **Figure 3**.

TRAFFIC VOLUMES

In order to determine the existing traffic volume flow patterns within the study area, manual turning movement counts were gathered for the weekday morning (7:00-9:00 AM) and evening (4:00 – 6:00 PM) peak time periods for the study area intersections 1 & 2. For the Indigo Pointe intersection, trip generation estimates were completed for the 48 senior apartments along this roadway and assigned to the roadway network and balanced with existing traffic volumes.

The existing 2022 peak-hour traffic flow networks for the weekday AM and PM peak-hour periods are shown graphically in **Figure 4**. Count data sheets are provided in the Appendix of this report.

PROBABLE IMPACTS OF THE PROJECT

To estimate the impact of site-generated traffic volumes on the roadway network under Future conditions, Existing traffic volumes in the study area were projected to the Year 2024, which is when the proposed development is expected to be constructed and operational. Traffic volumes on the roadway network at this time will include all existing traffic, any new traffic due to normal traffic growth, and any traffic related to specific developments that are presently approved and expected to be completed by 2024 (in excess of normal traffic volume growth). Consideration of these factors resulted in the development of 2024 No-Build traffic volumes. Anticipated site-generated traffic volumes were then super-imposed upon the 2024 No-Build traffic flow networks to reflect 2024 Build conditions including the proposed development.

BACKGROUND TRAFFIC GROWTH

Based on a review of SCDOT count data for S. Irby Street (Station #31-0131), growth occurred at a 2.5-percent annual rate between 2018 and 2019. Volumes for S. Coit Street (Station #21-0473) declined slightly during this period. Reported volumes for 2020 were less due to the pandemic and have been excluded from the growth rate calculations. Based on the reviewed information, a 2.5-percent growth rate was developed and utilized for this report.

The projected 2024 No-Build AM and PM peak-hour traffic volumes, which include the 2.5-percent annual growth rate, are depicted respectively in **Figure 5**.

PLANNED ROADWAY IMPROVEMENTS

An access road known as Creekview Drive connecting Cherokee Road to the north to S. Irby Street to the south and east is proposed as part of the project and has been modeled for Future 2024 Build Conditions. A scenario in which Creekview Drive is not connected to Cherokee Road has also been reviewed for this report.

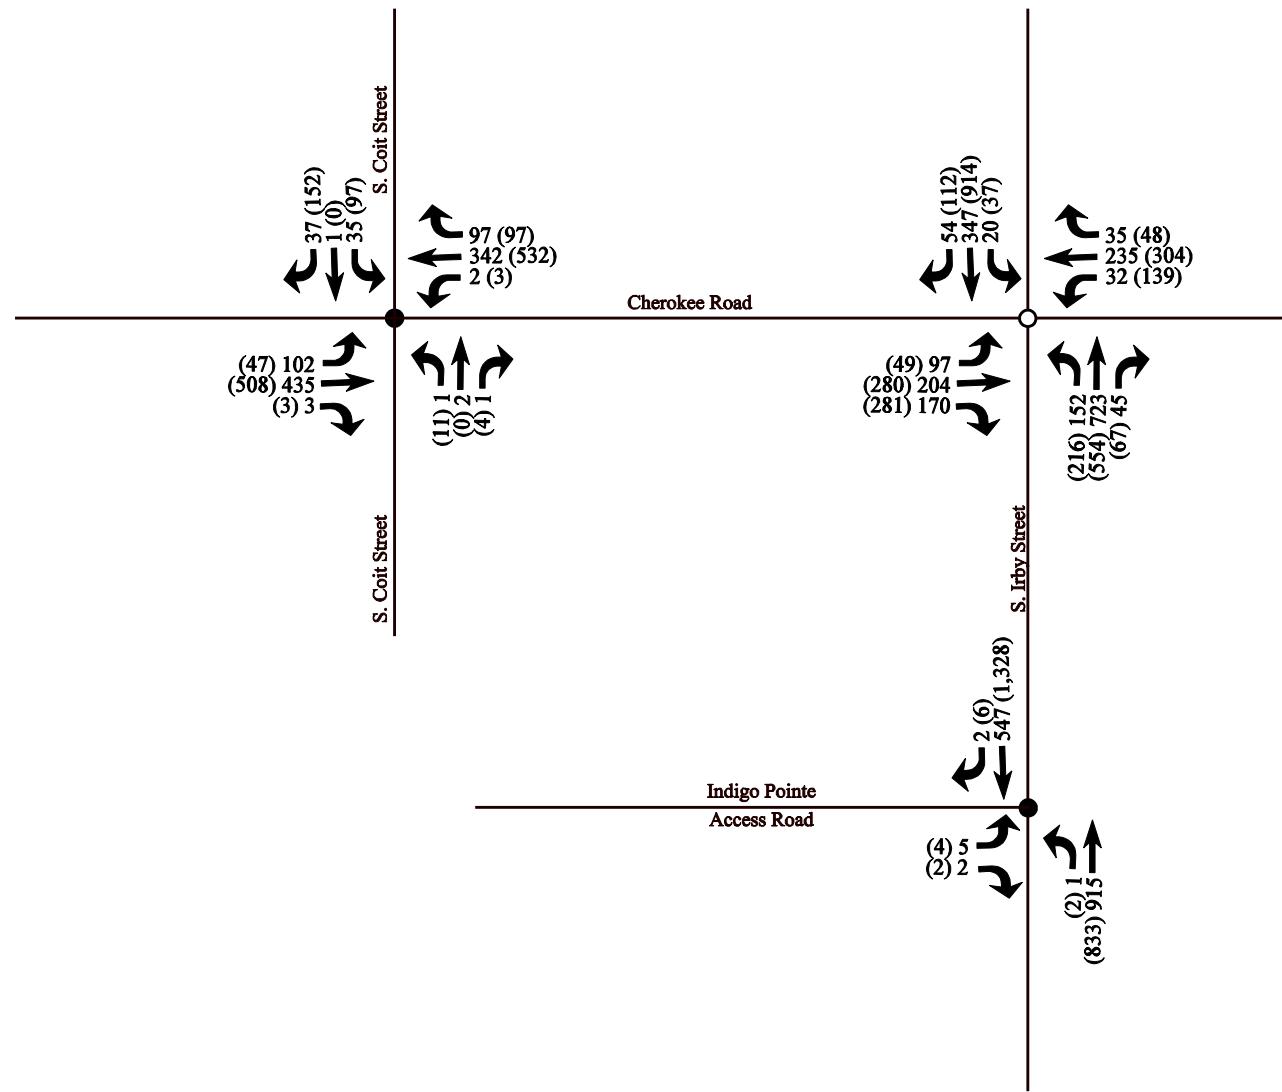

SITE-GENERATED TRAFFIC

Traffic volumes generated by the development were forecasted using the Ninth Edition of the Institute of Transportation Engineers (ITE) *Trip Generation* Manual¹. Land-Use Code #230 (Residential Condominium/Townhouse) was used to project site traffic. **Table 1** summarizes the anticipated trip generation characteristics for the project.

| Time Period | 60 Single-Family Attached Townhomes |
|----------------------|--|
| Weekday Daily | 412 |
| AM Peak-Hour | |
| Enter | 6 |
| <u>Exit</u> | <u>28</u> |
| Total | 34 |
| PM Peak-Hour | |
| Enter | 27 |
| <u>Exit</u> | <u>13</u> |
| Total | 40 |

1. ITE *Trip Generation* Manual, 9th Ed., LUC 230
Residential Condominium/Townhouse

As shown, this development can be expected to generate a total of 412 two-way trips on a weekday daily basis with 34 trips (6 entering, 28 exiting) during the AM peak-hour. During the PM peak-hour, a total of 40 trips (27 entering, 13 exiting) are expected.

TRIP DISTRIBUTION

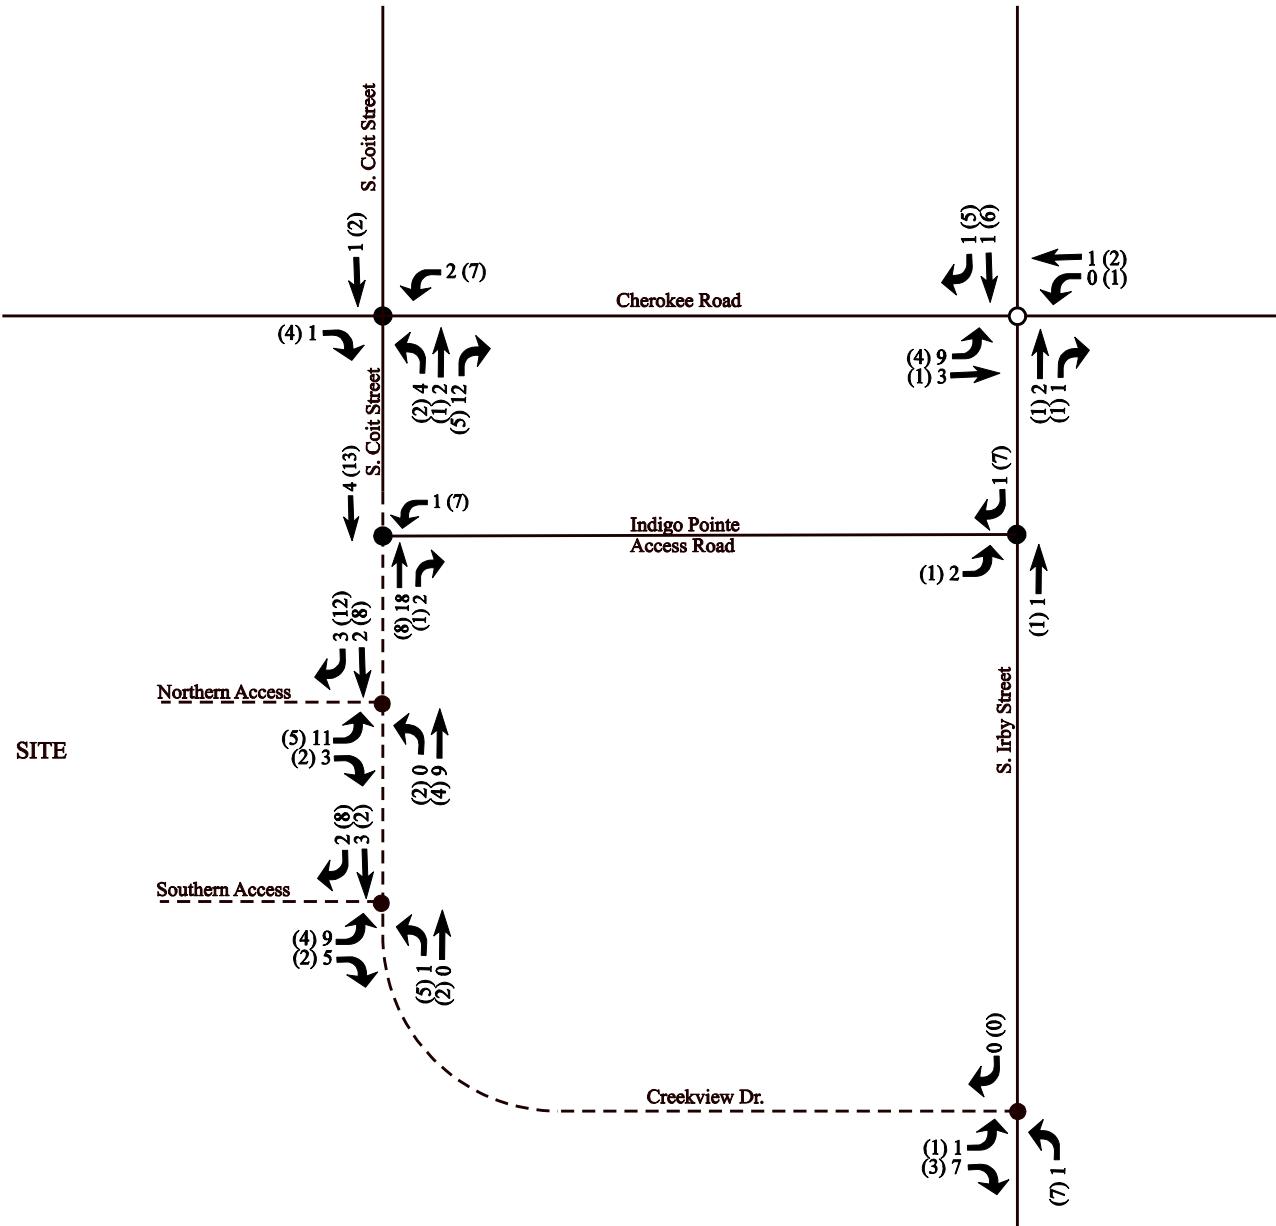

Based on a review of traffic patterns near the site, the following distribution percentages have been developed for project trips:

- S. Irby Street To/From North (Florence): 40%
- S. Irby Street To/From South: 25%
- Cherokee Road To/From West: 15%
- Cherokee Road To/From East 12%
- S. Coit Street To/From North: 8%

The site-generated traffic presented in Table 1 has been distributed within the study area based on the pattern described above. This has resulted in the site-generated specific volumes for the study area as depicted in **Figure 6A**. Traffic volumes have also been distributed for an Interim Scenario in which the connection to the north to Cherokee Road is not completed. The site-generated traffic for this scenario is shown in **Figure 6B**.

2024 BUILD TRAFFIC VOLUMES

The site-generated traffic volumes shown in Figure 6A have been added to the 2024 No-Build traffic volumes (Figure 5) to represent 2024 Build traffic volume conditions which are depicted graphically in **Figure 7A**.

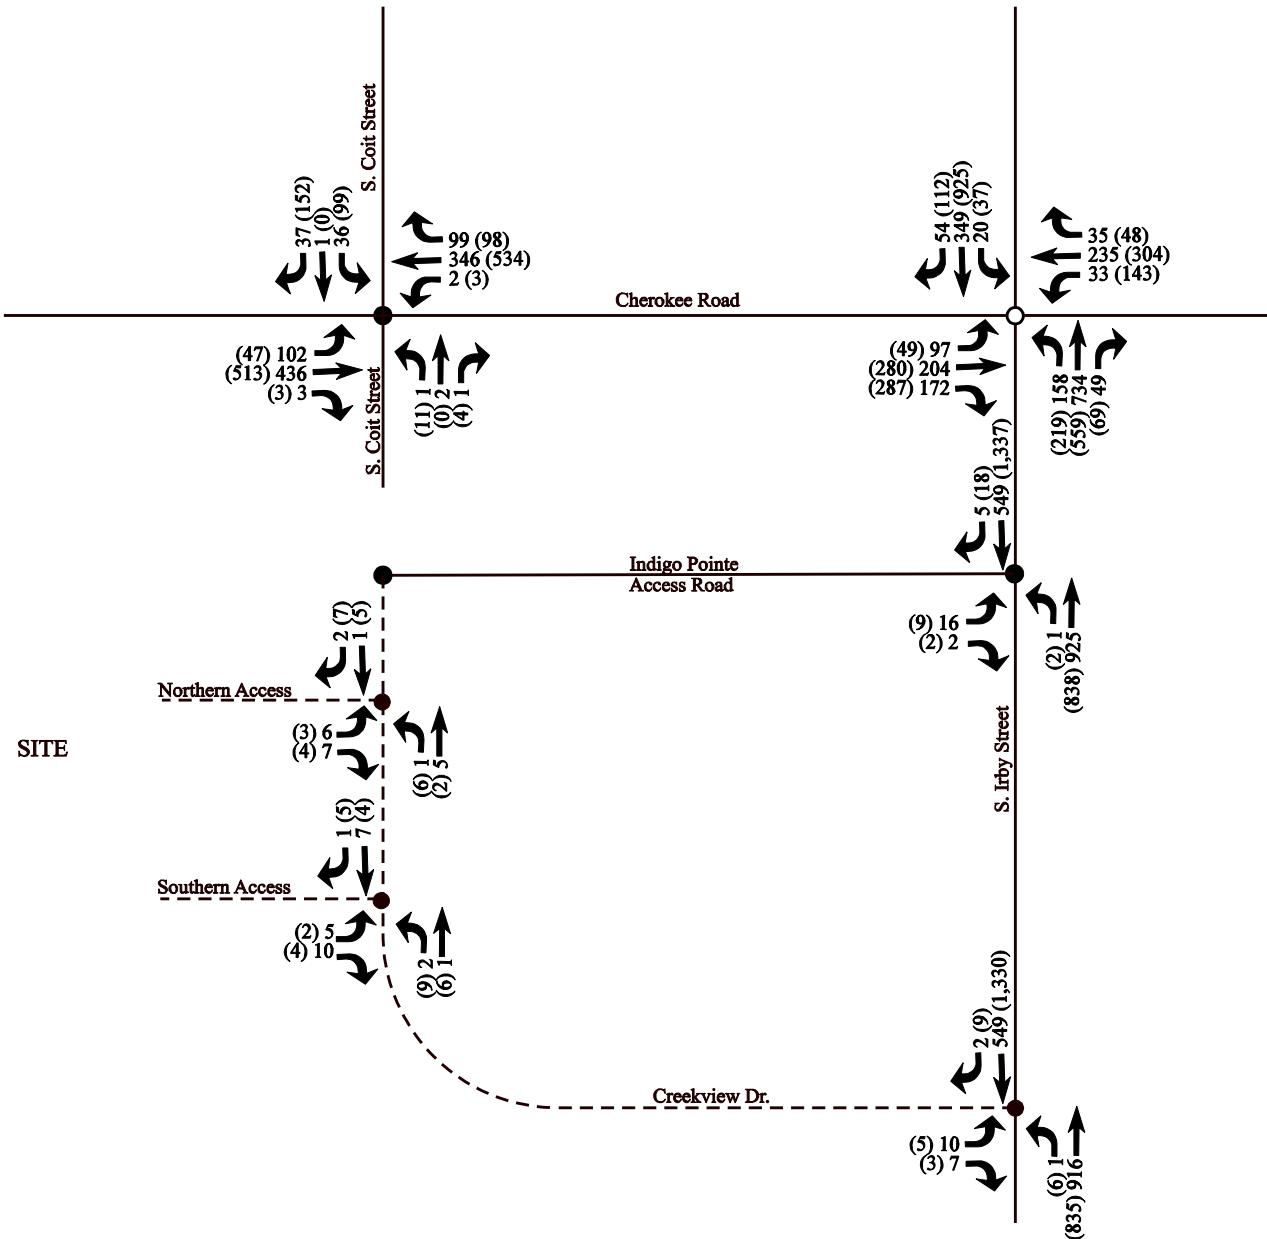

Figure 7A
2024 BUILD TRAFFIC VOLUMES
AM & (PM) PEAK HOURS
Indigo Townes: Florence, SC

One other adjustment has been made to the 2024 Build volumes shown in Figure 7A. With the completion of a connection to Cherokee Road, a significant portion (one third) of eastbound Cherokee Road traffic that is destined south on S. Irby Street is expected to utilize the new connection (right-turn from Cherokee Road traversing Creekview Drive and then making a right turn onto S. Irby Street). These movements have been subtracted from the right-turn movement at the S. Irby Street/Cherokee Road traffic signal. Left-turns from the south on S. Irby utilizing the new connection are not expected to be prevalent and will likely continue to utilize the exiting traffic signal that has a protected left-turn phase for this movement. It would not be logical to make a northbound left -turn from S. Irby Street and then incur delays with the unsignalized left-turn onto Cherokee Road westbound.

2024 Build traffic volumes for the Interim Scenario in which the connection to the north is not completed are shown in **Figure 7B**.

TRAFFIC OPERATIONS ANALYSIS

Measuring existing and future traffic volumes quantifies traffic flow within the study area. To assess quality of flow, capacity analyses were conducted under Existing, No-Build, and Build traffic volume conditions. Capacity analyses provide an indication of how well the study area intersections serve existing and future traffic demands.

METHODOLOGY

Level-of-Service

A primary result of capacity analyses is the assignment of level-of-service (LOS) to traffic facilities under various traffic flow conditions. The concept of level-of-service is defined as a qualitative measure describing operational conditions within a traffic stream and their perception by motorists and/or passengers. A level-of-service definition provides an index to quality of traffic flow in terms of such factors as speed, travel time, freedom to maneuver, traffic interruptions, comfort, convenience, and safety.

Six levels-of-service are defined for each type of facility. They are given letter designations from A to F, with LOS A representing the best operating conditions and LOS F the worst.

Since the level-of-service of a traffic facility is a function of the traffic flows placed upon it, such a facility may operate at a wide range of levels-of-service, depending on the time of day, day of week, or period of a year.

ANALYSIS RESULTS

Intersection analyses have been conducted for the study area intersection under Existing, Future 2024 (No-Build & Build) conditions. An Interim Scenario for the project has also been analyzed which reviews project impacts with no connection to Cherokee Road to the north. The results of these analyses are shown in **Table 2**. The intersection analysis worksheets are contained in the Appendix at the end of this report.

a. Delay in seconds-per-vehicle.

b. LOS = Level-of-Service.

As shown, under Existing 2022 conditions, operations depict overall acceptable LOS C operations for the signalized intersection of S. Irby Street at Cherokee Road during both peak hours. LOS D operations are present for the side-street approaches of Cherokee Road during both peak hours, which is typical for signalized approaches to a major arterial such as S. Irby Street where a majority of green time must be attributed to the major route. Delays for unsignalized intersection of Cherokee Road at S. Coit Street are minor in the AM peak hour, but there are some moderate delays (LOS E) during the PM peak hour as dictated by the northbound S. Coit Street approach, which must contend with heavier volumes for the southbound approach, mainly southbound right turns. These delays are not considered excessive and are typical for unsignalized intersections during peak hours.

A review of 2024 No-Build conditions, which account for normal background growth in traffic, indicates similar operations to that of Existing conditions. The signalized intersection of S. Irby Street at Cherokee Road is expected to maintain overall LOS C operations during both peak hours. Delays are expected to increase for the northbound S. Coit Street approach during the PM peak hour to LOS F operations. This is due to increased volumes along Cherokee Road and opposing right turns from S. Coit Street.

A review of 2024 Build Conditions, which account for specific volumes related to the proposed project and completion of Creekview Drive from Cherokee Road to S. Irby Street, analyses indicate slightly improved conditions over No-Build Conditions even when accounting for specific site traffic. This is due to the benefits of the new connection which will provide more options for area traffic. For example, a significant number of eastbound right-turns for Cherokee Road at S. Irby Street are expected to utilize Creekview Drive for southbound movements onto S. Irby Street which will relieve the traffic signal. This will also provide moderate relief for the STOP controlled northbound approach of S. Coit Street at Cherokee Road and improve the service level for this approach from LOS D to C during the AM peak hour and from LOS F to LOS E during the PM peak hour. A slight improvement is also observed for the S. Irby Street at Indigo Pointe Access with reduced southbound through volumes that will utilize Creekview Drive.

A review of the Interim Scenario in which the connection to the north to Cherokee Road is not completed, analyses indicate that operations within the area will remain similar to that of 2024 No-Build Conditions. The two connections to S. Irby Street for this scenario (Indigo Pointe Access Road Creekview Drive) can adequately service project traffic for this scenario although delays will be slightly higher than with a completed connection to Cherokee Road.

Delays for both site access drives directly to Creekview Drive are expected to be low during both peak hours with LOS A operations for all movements for both scenarios. Recommendations for both of these access drives are provided in the next section of this report.

MITIGATION

The final phase of the analysis process is to identify mitigating measures which may either minimize the impact of the project on the transportation system or tend to alleviate poor service levels not caused by the project. Measures considered necessary to mitigate roadway system deficiencies are discussed below as they relate to the impacts of the proposed project.

SITE ACCESS

Direct access for the development is proposed via two driveways to Creekview Drive with the northern access proposed approximately 1,450-ft. south of Cherokee Road. The southern access is proposed approximately 550-ft south of the northern access.

Both direct access points are expected to operate with minimal delays with single approach lanes; one lane for each approach of Creekview Drive and one lane entering and one lane exiting for each access placed under STOP sign control.

Creekview Drive

Analyses conducted for this report indicate that Creekview Drive will function acceptably with a two-lane cross-section. This connection will tie to S. Irby Street approximately 2,600 ft. south of Cherokee Road. If/when additional development occurs along this roadway the need for dedicated turn lanes should be reviewed. With regards to the new approach to S. Irby Street, one shared left/right lane operating under STOP sign control will be sufficient, although construction of two approach lanes at S. Irby Street should be considered to plan for the future. This would not be necessary to service the residential development analyzed for this report. Northbound left-turns from S. Irby Street onto the new connector can be serviced from the existing center left-turn lane. Analyses indicate that southbound right-turns are expected to be minimal and a southbound right-turn deceleration lane is not recommended for S. Irby Street.

Creekview Drive is expected to be a benefit for exiting and projected traffic in the area and will provide better connectivity for the area.

OFF-SITE IMPACTS

Analyses indicate that Creekview Drive will have a positive impact on all off-site intersections studied for this report when compared to 2024 No-Build conditions. Based on this information, no additional off-site Mitigation is recommended.

INTERIM ACCESS SCENARIO ANALYSIS

It is understood that FEMA coordination will be needed to complete a connection from Creekview Drive to the north to Cherokee Road. If this connection to the north is not completed, site traffic would utilize the connection to S. Irby Street to the south of the site, and also the existing Indigo Pointe Access Road that ties to S. Irby Street just south of the Jiffy Lube and Italian restaurant approximately 600-ft. south of Cherokee Road. Analyses indicate that delays within the study area would be similar to that of 2024 No-Build

Conditions. The two connections to S. Irby Street for this scenario (Indigo Pointe Access Road and the new Creekview Drive) can adequately service project traffic for this scenario although delays will be slightly higher than with a completed connection to Cherokee Road.

POTENTIAL ADDITIONAL DEVELOPMENT

There is the potential for additional development along Creekview Drive, however no specific uses have not been finalized at this time. Trip generation estimates for additional residential and commercial uses are provided in the Appendix of this report for information only. It is understood that additional study may be required prior to additional development along the roadway.

CONCLUSIONS

This traffic study has been prepared to evaluate the traffic impacts of a proposed single-family attached residential development with 60 dwellings along the west side of the proposed Creekview Drive, in Florence, SC. The project is expected to be developed and occupied by 2024 which is the horizon year that has been reviewed for this report.

Analyses indicate that existing operations are acceptable for the S. Irby Street at Cherokee Road intersection during both peak hours. Delays for the unsignalized intersection of Cherokee Road at S. Coit Street are minor in the AM peak hour, but there are some moderate delays (LOS E) during the PM peak hour as dictated by the northbound S. Coit Street approach, which must contend with heavier volumes for the southbound approach, mainly southbound right turns. These delays are not considered excessive and are typical for unsignalized intersections during peak hours.

Future 2024 Conditions without the project indicate similar operations for the study area with higher delays (LOS F) for the S. Coit Street intersection during the PM peak hour. The proposed Creekview Drive with connectivity to Cherokee Road is expected to result in improved operations for 2024 Build Conditions at all off-site intersections even with additional traffic related to the proposed residential development.

Analyses conducted for this report indicate that Creekview Drive will function acceptably with a two-lane cross-section. This connection will tie to S. Irby Street approximately 2,600 ft. south of Cherokee Road. If/when additional development occurs along this roadway the need for dedicated turn lanes should be reviewed. With regards to the new approach to S. Irby Street, one shared left/right lane operating under STOP sign control will be sufficient although construction of two approach lanes at S. Irby Street should be considered to plan for the future. This would not be necessary to service the residential development analyzed for this report. Northbound left-turns from S. Irby Street onto the new connector can be serviced from the existing center left-turn lane. Analyses indicate that southbound right-turns are expected to be minimal and a southbound right-turn deceleration lane is not recommended for S. Irby Street. Creekview Drive is expected to be a benefit for exiting and projected traffic in the area and will provide better connectivity for the area.

It is understood that FEMA coordination will be needed to complete a connection from Creekview Drive to Cherokee Road. If this connection to the north is not completed, site traffic would utilize the connection to S. Irby Street to the south of the site, and also the existing Indigo Pointe Access Road that ties to S. Irby Street just south of the Jiffy Lube and Italian restaurant approximately 600-ft. south of Cherokee Road. Analyses indicate that delays within the study area would be similar to that of 2024 No-Build Conditions. The two connections to S. Irby Street for this Interim Scenario (Indigo Pointe Access Road and Creekview Drive) can adequately service project traffic for this scenario although delays will be slightly higher than with a completed connection to Cherokee Road.

For either scenario, both direct access points are expected to operate with minimal delays with single approach lanes; one lane for each approach of Creekview Drive and one lane entering and one lane exiting for each access placed under STOP sign control.
